

TITLE: METHOD AND APPARATUS FOR VERTICALLY STUFFING
CASINGS WITH SAUSAGE EMULSION

5 BACKGROUND OF THE INVENTION

Sausages have been traditionally made by filling the natural intestines of sheep and other animals with a sausage product whereupon the filled natural casing was formed into links for cooking. At more modern times, sausages are
10 predominantly made by introducing an emulsion into an artificial casing, which in cases the sausage material through linking and preliminary cooking. Machines for making sausages with artificial casings have a high volume capability (up to 30,000 sausages per hour). Efforts have
15 been made to use these high speed machines with natural casings. However, because of the nature of the natural casings, including the relatively shorter and variable length and non uniform diameter, modern sausage encasing machines have not achieved the volume and capacity with
20 natural casings as they do with artificial casings.

It is therefore a principal object of this invention to provide a machine for encasing sausages that improves upon the state of the art.

A further object of this invention is to provide a
25 sausage encasing machine that is vertically aligned to allow gravity to enhance the movement of the casing.

Yet a further object of this invention is to reduce bunching of the casings.

These and other objects will be apparent to those
30 skilled in the art.

BRIEF SUMMARY OF THE INVENTION

A machine for encasing sausages that has a vertically disposed stuffing tube. The vertically disposed stuffing tube has a lower discharge end, a means for rotating the stuffing tube, and a means for moving upward and downward. The machine also consists of a twister mechanism and a linker. A conical shaped restricting device is located at the lower portion of the tube and aids in straightening the casing out before it enters the twister. Because the sausage encasing machine is set up vertically, the movement of the shirred casing is enhanced by gravity.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a side view of a sausage making machine showing the conventional components modified by this invention having a sectional view of the conical shaped restricting device.

DESCRIPTION OF THE EMBODIMENTS OF THE INVENTION

The term "emulsion" as used herein includes meat or any other such edible substance.

With reference to Fig. 1, a sausage making machine has a frame 11, and a slidable stuffing tube 14. The sausage making machine further has a twisting mechanism 16, a linking mechanism 18, a discharge horn 20, and a conveyor 22.

The sausage encasing machine 10 is set up in a vertical plane. The sausage machine 10 has an air cylinder 24 that is operably connected to both a rotator 26 and a stuffing block 28 and is attached to the stuffing tube 14. At the end of the stuffing tube 14 is a conical shaped restricting device 30 that is attached to the twister mechanism 16.

Connected to the stuffing block 28 is a metering pump 32 and a source 34.

5 In operation the meat emulsion is pumped from the source 34 through the metering pump 32 into the stuffing block 28. The emulsion then proceeds to stuffing tube 14 and into a casing 36. The casing 36 is then guided off the tube 14 and into the twister mechanism 16 by passing through the conical shaped restricting device 30. Because gravity assists in feeding the casing 36, and hence the restrictor 10 30, the casing is straightened by the restrictor 30 before entering the twister mechanism 16, thus reducing bunching in the casing 36. If needed, water from a water source may be sprayed into the restrictor 30 to help the casing 36 more easily slide through the restrictor 30. After the casing 36 15 slides through the restrictor 30 it then proceeds through to twister mechanism 16, then into linking mechanism 18, down to discharge horn 20 and finally engages conveyor 22.

It will be appreciated by those skilled in the art that other various modifications could be made to the device 20 without the parting from the spirit in scope of this invention. All such modifications and changes fall within the scope of the claims and are intended to be covered thereby.
